second edition 2010

Preface to the second edition

This edition of my 1992 English vocabulary tests is largely of historical interest. I have made it available here because the original versions have been out of print for some time. In spite of their limited circulation, the 1992 tests are being cited with surprising frequency, and some surprisingly strong claims for their efficacy and accuracy have been made.

The tests presented here are essentially the same as the original versions, except that the format has been improved to take account of 2010 typographical conventions. I have also made a number of small changes to the words. Some of the longer imaginary words have been shortened, and some of the less plausible items have been replaced completely.

The original tests were developed almost twenty years ago, and a lot of water has gone under the bridge since their first publication. With hindsight, it is obvious that the tests needed a lot of further development work, and a number of important issues which troubled me at the time remain unresolved.

The most important of these unresolved issues is the scoring system, and the way YES responses to imaginary words are used to correct the raw scores provided by the test. The original formula that I used in the 1992 work made some incorrect mathematical assumptions that resulted in errors being scored very harshly where the total number of YES responses was low. There have been a number of attempts to correct this bias, notably Beeckmans, Eyckmans, Jansens, Dufranne and van de Velde (2001), Huibregtse, Admiraal and Meara (2002) and Mochida and Harrington (2006), but none of these attempts is entirely satisfactory. I am currently working on Bayesian model which I hope will settle this issue once and for all, but this work was not completed in time to be included in this edition.

Users of these tests should also be aware of a number of other issues which were not obvious at the time of the original work. These include:

- The unsatisfactory nature of the original source lists, particularly Hindmarsh (1980) which provided the source material for the level 3, 4 and 5 tests. Hindmarsh's counts now appear to be somewhat eccentric, and is probably a poor source for tests of this sort.
- Technological developments have been remarkably rapid since 1992, and this has resulted in significant changes to the frequency pattern of English words. *Telegram* (level 1) is now probably obsolete, and *cheque* (also level 1) looks likely to follow the same path to oblivion in the near future. On the other hand, words that have leaped to prominence on the back of digital communications do not appear in these lists. *Text*, for example, was a relatively infrequent word in 1992, largely confined to a couple of very specific genres. Thanks to mobile phones, *text* must be one of the

most frequent words to occur in everyday spoken English in 2010. A significant number of items that were non-words in 1992 have now taken on fixed meanings, and these have been replaced in this updated version.

- The tests included here are rather long – each test consists of 60 items, 40 real words and 20 imaginary words – but test-takers are recommended to complete three tests, giving a total of 180 test items for each vocabulary level. There are five levels in all, so a complete test would require fifteen tests to be completed. This would be daunting even for an extremely keen test-taker. Our more recent work in this area has put more emphasis on shorter tests. The X_Lex tests, for example (Meara and Milton 2003), uses only 120 items to test the first five levels. The X_Lex tests are probably less reliable than the more detailed tests included here, but they can be useful as a way of highlighting vocabulary levels testees know quite well, and which levels would benefit from the more detailed probing that these tests make possible.

One unavoidable conclusion is that the whole concept of a “vocabulary level” is much more complicated than we think it is. Dividing a large lexicon up into equal size chunks of 1000 words is at best a convenient fiction. And when these chunks are derived from frequency lists which do not reliably represent the real difficulty of words for learners, then the risk of distortion is extremely high.

Clearly what is needed here is a much better source list. Frequency lists, which are generally not based on the sort of language that learners are exposed to, are not the ideal source for a vocabulary size test aimed at L2 speakers. A proper source list which reflected the probability of L2 learners actually knowing the items being tested, and backed up by some serious empirical data in this regard, would be a significant resource for vocabulary development. In my view, a list of this sort is a resource which is long overdue.

Paul Meara
May 2010

Introduction

This book contains a set of tests designed to be used with learners of English as a second language. The tests are graded into six levels of difficulty, and there are twenty tests at each level. Teachers can use the tests to provide a rough lexical profile of individual students, or to monitor the progress of students whose lexical profile has already been established.

Each level corresponds to a basic vocabulary of about 1000 words. The word lists that the tests are based on are described in detail in Appendix B.

The basic tests are Levels 1 and 2. These tests cover the core vocabulary of English - 2000 words that every speaker needs to know if they want to understand what they hear or read, and if they want to make themselves understood. Level 1 represents a basic level of competence - enough for learners to get around with some difficulty, but not enough for them to communicate easily with native speakers. Learners who score less than 75% on this test are not really functional in English, but they should be able to cope with some limited and predictable situations. Level 2 represents a slightly more advanced vocabulary: the 2000 words of levels one and two taken together represent the core vocabulary of English. These words are more frequent than any other words in English, and occur in a very wide range of texts and situations. If you take any ordinary text, and look at the words it includes, you will generally find that about 80% of the words come from the first 2000 words of English. In some cases, especially in texts which are deliberately simplified for non-native speakers, this figure can rise even higher. This means that a learner who knows the basic 2000 word vocabulary should be able to recognise 80% of the words in any text he comes across. Learners whose vocabularies don't include these basic 2000 words are not going to be fluent readers, and will generally have difficulty coping with situations which are any way out of the ordinary.

In our experience, more advanced learners have bigger vocabularies than less advanced ones. This isn't always the case, of course. We sometimes find learners with quite large vocabularies who are quite unable to put two or three words together into a coherent sentence. Cases like this are unusual, though. Generally speaking, people with big vocabularies are better at listening comprehension, better at reading comprehension and have better developed grammatical sense than people with very small vocabularies. We aren't really sure why this should be. In theory, it would be possible to know English grammar very well, but to have only a very limited vocabulary. Indeed, lots of English language courses are based on this very principle: they put a great deal of emphasis on grammatical accuracy, and introduce a very restricted range of vocabulary. In real life, however, vocabulary seems to be much more important than good grammar, and most learners seem to realise this. Good language learners make sure that

Meara 1992z

they see and hear as much of the L2 as they possibly can, and in the course of this exposure they pick up huge numbers of words. They also pick up other things too, of course, but the fact that they are also picking up new words means that the size of someone's vocabulary can be used as a rough guide to other language skills too.

As a rough rule of thumb, learners with a vocabulary of less than two thousand words can be considered very elementary. Learners with a vocabulary of about 3000 words should be able to cope with an examination like the Cambridge First Certificate in English. Learners with a vocabulary closer to 5000 words would normally be classed as Intermediate level. You need seven or eight thousand words to cope with an examination at Cambridge Proficiency level. These guidelines are not hard and fast, of course: some learners with very limited vocabularies have very good coping strategies which allow them to perform better than we would expect them to. In general, however, the guidelines are fairly reliable: it would be a very exceptional learner who passed a Proficiency level examination with a vocabulary of only 4000 words.

The tests in this book provide a quick method of profiling the vocabularies of learners.

The easiest way of producing a profile is to get the testee to do one test at each of the five main levels. Each test takes about three minutes to complete, so it should be possible for a testee to take five tests at different levels in less than 20 minutes. Appendix A shows you how to score a test. Five tests will give you a profile like the one shown in Figure 1. This figure shows a typical First Certificate level learner, who knows most of the basic vocabulary, but has rather serious gaps among less frequent words.

It is not always necessary to do five tests from different levels. Sometimes, it will be obvious that a learner is not very advanced, in which case it would be a waste of time to ask them to do the level four or five tests. Sometimes, it will be obvious that a learner is already fairly advanced, and in that case it might be worthwhile skipping the elementary tests at level 1 and level 2. Generally, the profiles you obtain will slope gently from left to right, like the profile shown in Figure 1. This pattern arises because most people acquire simple vocabulary before they acquire more difficult vocabulary. However, this is not always the case, and it is sometimes necessary to watch out for people who produce peculiar, unbalanced profiles like the one shown in Figure 2. This type of profile is sometimes produced by people with a good specialist knowledge of English, but only limited practical experience. They may be able to lecture about English literature, but they have serious problems negotiating a cup of coffee or a bus ticket.

Vocabulary profiles have two main uses. They were originally designed as a way of assessing the level of learners used in experimental tests. Very often when you run

Figure 1: A “typical” profile

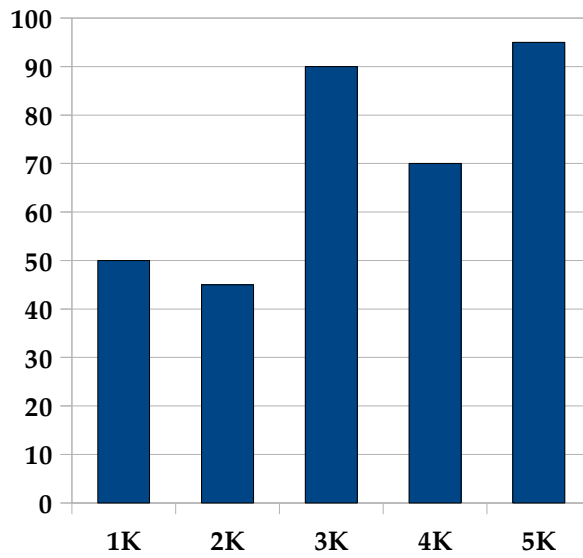

Figure 2: An unusual profile

experiments in second language learning, you need to be able to describe the language skills of the people you are testing. In most cases, the only data you have available is how many years the subjects have spent studying English. This measure is a very crude measure of English proficiency, of course: five years of English in Riyadh is often very different from five years of English in Amsterdam; a good learner studying seriously for two years will often get much farther than a poor learner studying spasmodically for five years. The vocabulary tests provide a rough and ready way of working out how much people have learned in the course of their study, and this is a much better way of screening for experimental tests than simply noting how long they have been studying for. So, for instance, if I wanted to run a study on moderately advanced learners, I could use these tests as a way of screening out people with a total vocabulary size of less than 4000 words. Alternatively, if I was interested principally in beginners, I could screen out people who scored more than 2500 words. Again, if I wanted to have two groups of subjects, matched for language skill, I could put together two groups whose scores on the vocabulary test were the same. This seems to be a considerable advance on the usual method of establishing the language skills of an experimental group.

It soon became apparent, however, that the vocabulary tests were not just limited to this use as experimental screening tests. It turned out that the tests were actually quite good at making broad distinctions between groups of learners, and this made me wonder whether it would be possible to develop a formal placement test using the same technique: i.e. a test which could be used to assign learners to classes at a level appropriate to their language skills. We eventually developed a test of this sort for the Eurocentres language schools. This test, which is fully computerised, is based on a vocabulary of 10000 words, and is suitable for a wide range of learners, from the fairly elementary to the advanced quasi-native speaker. It takes 10 to 15 minutes to run the test, and the scoring is automatic. The scores from this test correlate well with tests of listening comprehension, reading comprehension and grammatical skills, but not with oral fluency. A full description of this work will be found in Meara and Jones (1990).

The pencil and paper version tests presented here are largely based on this work for Eurocentres, but it incorporates some later refinements which were not included in the original Eurocentres test.

As well as their use as screening and as placement tests, the tests in this book can also be used in a third way. Very often language schools need to be able to demonstrate that the people they are teaching are actually learning something. This is often more difficult than it looks at first sight. Most existing language tests measure a wide range of global skills, which don't develop very much over short periods. For instance, if you tested a student on the IELTS test at the beginning of a four week course, you wouldn't expect to find a huge improvement by the end of the course: IELTS, and tests like it, are

just not sensitive enough to pick up changes of that sort. Vocabulary is a much more sensitive measure, and small changes in vocabulary size are easy to monitor. Vocabulary tests also have the advantage that they are easy to interpret to non-specialists: an improvement of 0.5 points on IELTS doesn't sound very impressive, and it is difficult to explain to an unsophisticated enquirer - a parent, or an employer, for instance - what it means in real terms. A 25% improvement in basic vocabulary - and by extension, a substantial improvement in other skills as well - is much more straightforward and more tangible. Changes of this sort can be picked up by administering a selection of these tests over a period of several weeks. Figure 3 shows the type of data that this produces: the subject is a low-level Japanese girl, tested every week with a test in the level 2 range. There is a certain amount of variation in the scores, but underneath this variation is a steady upward trend that shows up clearly in the test scores.

Figure 3: A series of level 2 tests

How the tests work

The tests in this book are rather different from conventional vocabulary tests. The usual way of testing vocabulary is through multiple choice tests like the ones used in the Cambridge Proficiency and other public examinations. Items of this sort look like this:

You make tea by _____ water and pouring it over the leaves.

Meara 1992z

1: oiling 2: boiling 3: burning 4: finding

The correct answer, of course, is item 2, *boiling*. The other possibilities are more or less plausible, but incorrect. Test items of this sort are extensively used by examining boards, but they suffer from a number of serious disadvantages.

The main disadvantage of multiple choice tests is that they are inherently messy: the item above ostensibly tests whether the student understands the word *boiling*, but actually, it tests understanding of all the other words, too. If you do not understand *tea*, and *water* then your chances of getting the item correct are pretty slim. The public examination boards get round this problem by extensive pre-testing of items, and a sophisticated statistical analysis of the results. This process is very expensive, and pretty much beyond the possibilities of anyone who is not backed up by a very large research organisation.

The second problem is that multiple choice items are not easy to answer, and this restricts the number of items that a student can reasonably be asked to attempt. The forty item Cambridge tests, for instance, take about 45 minutes for an average student. This is fine in the context of a public examination, but is far too long for a quick assessment of the sort that we are interested in here: 45 minutes is just too long. Shortening the tests by including fewer items in the test is not a solution to this problem. In the context of a whole vocabulary, 40 items is not really very many: if the testee's total vocabulary is around 4000 words, then a 40 item test is equivalent to a sample of 1 word in every 100. This is not a very high sampling rate: even so, if the testees's vocabulary size is greater than 4000 words, then we need an even longer test to keep the same sampling rate. A vocabulary of 5000 words would need a 50 item test, 6000 words a 60 item test, and so on. This is clearly impractical.

The tests provided here get round both these problems in a rather unusual way. Each test consists of 60 items, and these items are simply single words. All the testees have to do is to decide whether they know the word or not, and to mark the word with a Y or an N. The advantage of this simple technique is that it is very quick: testees require only a couple of seconds to make a decision about a word they really know, and this means that even a 60 item test only takes a few minutes to complete. An average testee can complete 5 or 6 of these tests in less than half an hour.

If all testees were strictly honest and reliable, we could simply present a list of words in this way, and ask the testees to tell us whether they know them or not. Unfortunately, people aren't 100% reliable, or 100% honest. Some people will claim to know a word when they really mean that they know they have seen it: others will claim to know a word only if they use it at least five times a week. Some people will say they know a word even if they are not really sure; others will claim to know it only if they are absolutely sure they

Meara 1992z

could give you a dictionary definition. Some people deliberately cheat; others are scrupulously honest. All this means that we cannot just give people a list of words and treat their replies at face value.

What we can do, however, is to build in an automatic check, which will tell us if people's self-assessments are reliable or not. In these tests, we have done this by including in each test a number of non-existent, imaginary words. These items enable us to make an educated guess about how much guessing a testee is making. Testees who say YES to lots of imaginary words are likely to be less reliable in their real-word judgements than more cautious testees. The details of the scoring method are explained briefly in Appendix A. Basically, we take the number of real words that the testee claims to know and the number of imaginary words that the testee claims to know. These two figures go into a formula which estimates the actual number of words the testee knows on that test. Testees who guess, or who say yes when they are not really sure, get penalised by the formula, and should end up with a lower score than someone who only says yes when they are fairly sure they know what the meaning of the items in the test. The scoring system is designed so that it works independently of how strict the testee is in deciding whether he knows a word or not. A testee who says YES when he isn't very sure will generally say YES to a large number of imaginary words, and this should depress his overall score. Testees who say YES only when they are absolutely sure will produce a low score, but they will generally say NO to most of the imaginary words, and this means that their final score will not be reduced for errors.

Each test contains 40 real words and 20 imaginary words, and since the tests are based on word lists containing about 1000 words, each test comprises a one in twenty-five sample from the word list ($1000/40=25$). This sampling rate is very high compared with most other tests, and it allows us to estimate a testee's vocabulary knowledge with a fair degree of accuracy. Even more reliable estimates can be obtained by getting a testee to fill in two or three tests at the same level. Five tests from the same difficulty level, for example, provide a sampling rate of approximately one word in five, and this should be more than adequate for most practical purposes.

some important cautions

The tests in this book have not yet been validated with large populations of learners of English as a second language. One of the main reasons for publishing them in this format is that we hope it will encourage other people to use the tests in situations that we have not been able to explore ourselves.

We have used these tests extensively with a wide range of learners who were native

speakers of Indo-European languages - mainly, French, Spanish, Italian and the Germanic languages. These speakers pose particular problems for a vocabulary test, because their own native languages share large numbers of words with English. This is particularly a problem when we are trying to assess how many English words speakers of romance languages and Greek know. These languages have influenced the English language a great deal, and English contains very many words which are cognate with words in French, Spanish, Italian and Greek. These words are usually, but not exclusively, low frequency words in English: words like *emancipate*, *exclude*, *geocentric*, or *parliamentary* fall into this category. This pattern of cognate words means that speakers of romance languages can often guess the meaning of infrequent words in English, and can often appear to have a very large vocabulary in English, while their knowledge of basic English vocabulary is negligible.

In these tests we have tried to get round this problem by including a proportion of imaginary words that are made up of Greek and Latin roots. These items look very similar to real words based on Latin and Greek, and testees who are merely guessing the meanings of words based on similarities with their L1 will generally say YES to these words. These errors depress their total score, and make it a more accurate predictor of their real ability. This correction factor works reasonably well in practice: it tends to underestimate the passive vocabulary skills of Romance speakers, but seems to give a reasonably accurate measure of their active vocabulary knowledge. It does not affect native speakers of languages which are not cognate with English.

The Germanic languages, German, Dutch, Danish, Norwegian, and so on, also share a large part of their vocabulary with English, and this gives speakers of these languages some advantages over other learners. In general, however, it is high frequency English words which have cognates in the Germanic languages, and this means that distortions in the vocabulary scores due to cognates in Germanic languages are not so important.

French seems to pose a particular problem for these tests. We have consistently found that native French speakers score rather badly on these tests: i.e. the tests seem to underestimate their real vocabulary knowledge. This is mainly because French speakers seem to be more willing to accept imaginary words than speakers of other languages. At the moment we don't know why this should be, but it is a problem that should be borne in mind by anyone using these tests.

The Indo-European languages aside, our other major experience has been with Arabic speakers, particularly with native Arabic speakers at very low levels of proficiency, and we now have an extensive body of test data which shows that the tests are fairly reliable, even at this level. We have every reason to believe that the tests will also work well with other language groups, and we would be very glad to hear from readers who use

Meara 1992z

the tests with groups that we have not been able to test ourselves.

In the meantime, users are advised that they should NOT use these tests in situations where very high levels of accuracy are required, and important decisions, which might have serious legal consequences, should not be based on the results of the tests.

Appendix 1

How to administer and score the tests

administering the tests

Instructions for the testees are included on each test sheet. Each test takes approximately 5 minutes to administer. If testees take very much longer than this then they are spending too much time thinking about individual items. You may need to stress that if they are in any doubt, they should answer NO.

You will get more reliable data if the testee fills in two or more tests at each level of difficulty. This is particularly important if the scores produced on the test are low: the reliability of the tests falls with low scores.

scoring the tests

For each test paper, you need to calculate two scores, traditionally called HITS and FALSE ALARMS.

Hits are real words which evoke a YES answer.

False Alarms are imaginary words that evoke a YES answer.

To get these two measures:

Count the total number of YES responses.

Count the total number of False Alarms. The imaginary words in each test are listed in the table at the end of each set of tests.

Subtract the False Alarms from the Total Ticks. This gives the number of Hits.

Enter these figures next to H _____ and F _____ at the bottom of each sheet.

Now consult Table A2. This table consists of a matrix showing all possible combinations of Hits and False Alarm scores. Hits are recorded at the left of table, False Alarms along the top. Find the box that corresponds to your combination of Hits and False Alarms. The number in the box is your testee's score for that test. It is called Δm , (Delta m) and there is a space for this score on the answer sheet.

If either the number of hits is below 10, or the number of false alarms is greater than 10, then the results are likely to be extremely unreliable, and testees scoring in this range should be handled separately. If your testees score more than ten false alarms, then you can ask them to redo the test, but only to answer YES if they are absolutely sure. If your testees score fewer than 10 hits, then the test is just too hard for them, and you should ask them to complete tests at an easier level.

Meara 1992z

The false alarm scores should be fairly similar in all the tests. If the false alarm scores vary a lot, then it is possible work out for each testee an average false alarm score over three or four tests, and you can substitute this average figure in table A2 if you wish.

The scores in Table A2 vary between 0 and 100, and for practical purposes they can be treated as percentages: i.e. a testee who scores 70 on a test has a vocabulary twice as large as one who scores 35.

Table A-2

Use this table to convert Hits and False Alarm Rates to a percentage vocabulary score.

	0.0	0.5	1.0	1.5	2.0	2.5	3.0	3.5	4.0	4.5	5.0	6.0	7.0	8.0	9.0	10.0

Appendix B

notes on the word lists

Two different word lists were used as the source for these tests. The Level 1 and Level 2 tests are based on Paul Nation's *Vocabulary lists: words, affixes and stems* (Nation 1986). Levels 3, 4 and 5 are based on Hindmarsh's *Cambridge English Lexicon* (Hindmarsh 1980). The final level A tests are also based on work by Nation.

Nation's 1000 word "Little Language" is based on extensive experience with low-level English language learners. It differs from some other word lists aimed at non-native speakers in that it is not strictly bound by frequency. Nation lists eight principles which influenced the inclusion of items in his basic list. They are:

the principle of language needs - words are included in the basic word list with a view to helping learners express as many ideas as possible, and to express the feelings and demands they want to make;

the principle of frequency - words which occur frequently in the language are included in the list, while less frequent words are excluded;

range - words which occur in many different types of written English are preferred over words which appear in only a limited range of sources;

the principle of economy - words whose meaning can be explained in simple paraphrases are excluded from the base list, as are words which have simpler synonyms;

the principle of regularity - words with regular morphology are preferred to words with marked irregularities, and words which appear in simple syntactic frames are preferred to words with more complex syntactic patterns;

the principle of defining power - words which are particularly useful for defining other words are included in the base list;

the principle of classroom and teaching needs - words which are particularly frequent in classroom situations are included in the base list;

the principle of including loan words - the base list includes a large number of words which are commonly loaned into other languages.

Nation sees the 1000 word Little Language as a basic productive vocabulary, which every learner needs to master in order to achieve minimal fluency. Ability to read everyday English material requires a rather larger vocabulary than this basic level, however, and Nation suggests that a minimal receptive vocabulary needs to include about 2000 additional words. Nation's second thousand word list forms the basis for my level two tests. This set of words is an expansion of the 1000 word little language. It contains words which students are likely to find in a wide variety of contexts outside classrooms, particularly news broadcasts, newspapers and professional or cultural magazines. It excludes common slang terms, and technical words which most people would not be expected to know.

Meara 1992z

Nation's third thousand word list forms the basis for my level A tests. This list is chiefly aimed at students interested in scientific and technical disciplines, and it includes a large number of terms which occur frequently in these areas.

The other levels are based on Hindmarsh (1980). In many ways this is a very unsatisfactory word list, and I have used it only because I was unable to find a better alternative. Hindmarsh's work is basically a revision of West's *General Service List* (1953).

Level 1: test 101

Write your name here : _____

What you have to do:

Read through the list of words carefully. For each word:

if you know what it means, write Y (for YES) in the box

if you don't know what it means, or if you aren't sure, write N (for NO) in the box.
